Neuropathological Findings in Pemphigus Vulgaris.

In this paper the histological changes found in the peripheral nerve endings, sympathetic ganglia, ganglion modosum, spinal cord, brain stem, hypothalamus, and cerebral cortex in 2 cases of pemphigus vulgaris are described. The changes in the peripheral parts of the nervous system were considered to be chiefly irritative in nature. The vegetative nerve centres in the spinal cord were more involved than those of the somatic nerves. The nerve cells in the hypothalamus, the cranial nerve nuclei, and the lateral horns of the spinal cord were more affected than the peripheral ganglia and there were therefore lesions in the preganglionic conduction fibres. Among the histological changes were beading and swelling of the nerve endings, chromatolysis and swelling of nerve cells, and occasional shrinking of the cells, with hyperchromatosis. Changes were also present in the cerebral cortex, but these were less marked than those in the hypothalamus, medulla oblongata, and spinal cord.

TITLE: Skin changes in exposed areas in later periods after roentgen and gamma therapy of malignant tumors

SOURCE: Meditsinskaya radiologiya, v. 8, no. 10, 1963, 43-47

TOPIC TAGS: skin change, roentgen therapy, gamma therapy, exposed area skin change, dermvascular response, skin temperature change, hair loss, hair pigmentation change, telangiectasis, sclerotic tissue

ABSTRACT: Skin changes in areas exposed to irradiation were studied in two groups of women 2.5-9 yrs after radiation therapy for malignant tumors of mammary glands, uterus, and ovaries. The first group (21 cases) had been treated with fractional doses of X-irradiation daily for 1-2 mos, and the second group (30 cases) had

Card 1/2 ✓

ACCESSION NR: AP3010672

been treated with fractional doses of gamma radiation daily for 1-2 mos. In the first group skin, hair, and dermavascular changes were found. In many cases skin texture and pigmentation were affected, hair pigmentation had changed or hair loss had occurred, and subcutaneous fatty cellular tissue was sclerotic. Telangiectasis was found in 18 cases. Also, in this group skin temperature was higher by 1-2° in exposed areas compared to symmetrical non-exposed areas. In the second group skin, hair and dermavascular changes were much rarer and less intense. Telangiectasis was found only in 5 cases. Skin temperature for exposed areas was within the normal range. Patch test reactions to histamine, carbocholine, and adrenalin solutions for both groups were normal in half of the cases and higher or lower in the other half. With higher concentrations of histamine and adrenalin the dermavascular responses changed and in some cases were reversed. It was established that 2.5-9 yrs after radiation therapy the functional damage to the dermavascular network in exposed areas is significant. Orig. art. has: None.

TITLE: Dependence of mechanical characteristics of glass plastics upon their water absorption

SOURCE: Plasticheskiye massy, no. 2, 1966, 70-71

fiberglass,

TOPIC TAGS: glass textolite, elastic modulus, tensile strength, chemical absorption/ KAST-V glass textolite, KAST glass textolite, AG-4s fiberglass

ABSTRACT: The relationship between the water absorption of glass textolites KAST-V and KAST and glass plastic AG-4s and their mechanical characteristics is examined. Tests of glass plastics for over 35 000 hrs show that the functions $\sigma(E) = f(w)$ are stably linear in a semilogarithmic coordinate system and are well approximated by the equation $\sigma(E) = \alpha + \beta \log w$. The correlation coefficients vary from 0.86 to 0.97. Comparison of the obtained data (see Fig. 1) shows that identical water absorption of different types of glass plastics is reflected differently in their strength and elastic characteristics. The nature of the obtained dependence is

TITLE: Oscillographic investigation of high pressure pulsed discharges in helium

SOURCE: Zhurnal tekhnicheskoy fiziki, v. 36, no. 7, 1171-1174

TOPIC TAGS: spark gap, spark discharge, high pressure, helium, electric resistance, electric power,

ABSTRACT: The author has investigated 35 kV discharges of a 3 μ F capacitor across gaps ranging in length at least from 2 to 10 mm in helium at pressures up to 60 atm. The inductance of the discharge circuit was 4.7 μ H and the maximum current was 29 kA. From oscilloscope records of the current and voltage, the resistance of the gap and the power expended in it were determined. The inductive component of the current across the gap was compensated on the oscilloscope with the aid of a network that involved a voltage divider but is not described in further detail. The compensating network was adjusted to compensate the discharge potential across a metallic cylinder bridging the gap and having a diameter equal to the maximum diameter of the spark channel, as determined beforehand by high speed photography. An accuracy of 10-15% is claimed for the measurements. The variations with time, gap length and helium pressure of the gap

Card 1/2

UDC: 537.525

L 02287-67

ACC NR: AP6025240

resistance and the power expended are presented graphically and are discussed. The gap resistance reached its minimum value after the current had passed through its maximum. The power developed in the spark, the energy expended during the first cycle of the discharge, and the ratio of that energy to the total discharge energy increased with increasing helium pressure, and that increase was the more rapid, the longer the gap. The powers developed in the discharges ranged between 1 and 10 MW. Orig. art. has: 1 formula and 6 figures.

TITLE: Initiation of long high-power discharge channels with an ionized gas current

SOURCE: Pribory i tekhnika eksperimenta, no. 4, 1966, 210-211

TOPIC TAGS: gas discharge, discharge plasma, pulse generator, ionized gas, electrode voltage stabilization, ignition, spark chamber, discharge chamber, electric capacitance

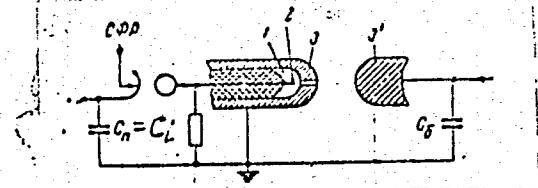

ABSTRACT: Discharge initiation through shorting the discharge distance with an ionized gas current was investigated inasmuch as the application of current pulse generators to the study of long discharge channels in gas under higher than atmospheric pressures and a break down voltage that is several times higher than the working voltage requires special discharge initiation methods. The discharge channel was produced in helium under a pressure of up to 100 atm and in the air. A diagram of the experimental unit is shown below. An ignition chamber (1), connected with the main discharge space by a hole 1.5 mm in diameter, is set in an electrode (3). The discharge of the ignition capacity C_i in the ignition chamber is effected after the keep-alive voltage V_{k-a} for the space under study is set up, i.e., after charging the battery capacity C_b . The temperature and gas pressure within the ignition chamber

UDC: 537.54

Card 1/2

ACC NR:AP6030160

drastically increase as a result of the discharge. The discharge products under the effect of the pressure rapidly pass through the hole and proceed to the opposite electrode (3). shorting, thereby, the gap. This is accompanied by a sharp increase in field nonhomogeneity and by a simultaneous decrease in the effective distance and in the photoeffect from the electrodes. This method of firing undercharged long gaps is considered superior to the generally used shorting wire method inasmuch as there is less soiling of the channel with metal vapors, no interruption or breakdown of the current, and little wear and tear due to the fact that only the insulation in the ignition chamber is destroyed in the course of operation. Furthermore, this kind of system can also serve as a time relay for separating two high voltage power discharges. Orig. art. has: f 4 figures.

TITLE:

Rhodanide Complexes of Lead
3. Anion Complexes of Lead With the Coordination Number 6PERIODICAL: Ukrainskiy khimicheskiy zhurnal, 1960, Vol. 26, No. 4,
pp. 418-422

TEXT: The authors of the present paper studied 1) the effect of the nitrate ions on the lead complex formation, 2) the actual value of the dissociation constant of rhodanide complexes, and 3) data on the isolation of the molecular lead rhodanides with the coordination number 6. To determine the composition and stability of the nitrate lead complexes, the solutions of lead perchlorate (with constant concentration) and sodium nitrate were potentiometrically investigated. A saturated calomel electrode served as reference electrode and lead amalgam as indicator. The $Pb(ClO_4)_2$ concentration was 0.01 M, that of sodium nitrate 0.2-2 M. The equilibrium electrode potentials were measured with the KWT-1(PPTV-1) potentiometer. The reduction of the lead electrode potential with in-

creasing nitrate ion concentrations in the system $Pb^{2+} - NO_3^- - H_2O$ indicates the formation of lead nitrate complexes. The $PbNO_3^+$ composition was graphically determined on the basis of the potentiometric data. The dissociation constant was calculated and found to be fairly stable; it amounts to 0.16 on the average. V. M. Samoylenko assisted in investigating the nitrate lead complexes. Furthermore, a potentiometric investigation was made of the formation of the lead rhodanide complexes of the anion type at constant ionic strength of the solutions which was maintained with perchlorate ions. The formation of the anion complex $Pb(CNS)_4^{6-}$ was confirmed and the actual value of its dissociation constant was found to be $1.83 \cdot 10^{-2}$ at an ionic strength of 6.5. On the basis of K.B. Yatsimirskiy's data and by means of the aforementioned constant, the solubility product of $Pb(CNS)_2$ was found to be $1.36 \cdot 10^{-7}$. The third problem was solved by crystallizing $KCNS + Pb(CNS)_2$ from acetone. The analysis of the salt obtained yielded:

AUTHORS: Golub, A. M., Romanenko, L. I.TITLE: The Influence Exercised by the Nature of the Solvent Upon the Formation of Thiocyanate Complexes¹ of Bivalent Mercury

PERIODICAL: Zhurnal neorganicheskoy khimii, 1960, Vol. 5, No. 5, pp. 1085-1089

TEXT: The authors made a potentiometric investigation of the thiocyanate complexes of mercury which form in pure non-aqueous solvents or at high concentrations of such solvents in water. Acetone and methanol were used as solvents. The equilibrium constant for $Hg^{2+} + Hg \rightleftharpoons Hg_2^{2+}$ was determined. The composition of the complexes resulted graphically from the diagrams $\lg Hg_2^{2+}$, $\lg CNS^-$ (Figs. 1-4). The experimental data are presented as follows: value of $K = [Hg_2^{2+}] / [Hg^{2+}]$ in the various solvents (Table 1); potentiometric investigation of the system $Hg^{2+} - CNS^- - H_2O - CH_3OH$ (Table 2); system $Hg^{2+} - CNS^- - H_2O - CH_3COCH_3$ (Table 3); system $Hg^{2+} - CNS^- - CH_3OH$ (Table 4), and system $Hg^{2+} - CNS^- - H_2O$ (Table 5). The statement made by A. I. Pozigun (Ref. 3) that the anion complexes of mercury with

thiocyanate ions may possess the coordination number 6, was confirmed. With increasing concentration of the non-aqueous solvent the composition of the anions becomes more complicated up to $\text{Hg}(\text{CNS})_6^{4-}$, whereas in anhydrous solvents simpler complexes are formed. The $\text{Hg}(\text{CNS})_6^{4-}$ complexes form in aqueous solution at KCNS concentrations of between 2.4 and 3.4 moles/l. The dissociation constants of the complexes $\text{Hg}(\text{CNS})_4^{2-}$, $\text{Hg}(\text{CNS})_5^{3-}$, and $\text{Hg}(\text{CNS})_6^{4-}$ in the various solvents were calculated. There are 4 figures, 5 tables, and 5 references, 4 of which are Soviet.

TITLE: Obtaining ferrite precipitates on metals by the electrophoretic method

SOURCE: IVUZ. Radiotekhnika, v. 8, no. 3, 1965, 362-364

TOPIC TAGS: electrolytic deposition, ferrite

ABSTRACT: The use of the electrophoretic method for deposition of ferrite particles on copper wire was investigated. The zinc-nickel ferrite used (Fe_2O_3 , 65.9%; NiO, 9.6%; ZnO, 24.5%), had a density of 4.67 gm/cm³ and magnetic permeability $\mu_0 = 1000$. It was mixed with ethyl alcohol and ball milled for 150 hr, after which a 5-10% ferrite suspension was obtained by decantation. To improve the electrolytic properties of the suspension, one drop of a 6% aqueous solution of cerium nitrate was added to the suspension. Before deposition, the copper wire was bathed in a 10% alkaline solution at 80-90C for 15 min, rinsed in distilled water, etched with HNO₃ for 10 sec, and rinsed again. Deposition was conducted for 2-10 min under a current of 2-20 mamp, depending on the surface area of the wire. Adhesion of the ferrite particles was assured by dipping the ferrite-covered wire into a 1:4 solu-

Card 1/2

L 1323-66

tion of MBK-1 glue in toluene and later drying it at 100C for 12 hr. The electro-phoretic process increased the inductance of the copper wires to 1 μ h from fractions of 1 μ h. Copper coils similarly processed showed an increase of inductance of 1.5 to 1.7 times. [PW]

1235. INDIRECT X-RAY THERAPY OF ALOPECIA AREATA (Russian text) -
Romanenko G. F. - NAUCH. ZAP. GORK. INST. DERM. I VENER. KAF.
KOZHNO-VENER. BOLEZ. GGMI 1956, 17 (166-170)

Fifty patients with alopecia areata were treated with X-rays (the method is described). The best results were achieved by irradiation of the cervical and lumbar regions. In some cases X-ray therapy was supplemented with bromides, caffeine and vitamins. Satisfactory results were obtained in 30 patients with a progressive or a static alopecia areata. Generalized forms and those lasting more than 2 years did not respond to the treatment. Indirect X-ray therapy is primarily indicated in cases of alopecia areata of a duration not exceeding 2 years. Title : Hemitodes Parasites of the Apple and Fruit Moth

Orig Pub : S. kh. Kirgizii, 1957, No 10, 34-35

Abstract : According to data of the forest experimental station of the Ministry of Agriculture of Kirgizia, paramount importance in the reduction of the number of moths in fruit orchards of Southern Kirgizi in 1956 was given to the ubiquitous occurrence there of two species of helminths of Hexameritis. The intensity of infection of caterpillars vacillated sharply from 0 to 80% in different ecological sections. The highest infection from helminths was in the ravine sculptured terrain in the lake district,

Card 1/2

- 18 -

caterpillar (in this case they were 1.5 - 3 cm with translucent cuticula). The caterpillars were infected at II - III instars. Before the cocoon stage (at the end of June - beginning of July) the larvae of the helminths passed through the thoracic segments, and the caterpillar perished. The helminths continued to develop in the soil in more moist beds: in summer at a depth of 20 .. 50 cm (30 and more species at 1 m²), in the fall at 10 - 20 cm, and in winter at 50 - 50 cm. -- A.P. Title : Poisoning of agricultural animals with superphosphate (fertilizer)

Periodical : Veterinariya, 8, 52, Aug 1954

Abstract : Superphosphates, particularly those containing fluorides, are often the cause of poisoning of agricultural animals. Poisoning usually takes place when fluoride mineral poisons are improperly stored and utilized or when they get into feed, water, or grazing lands. Symptoms of poisoning manifest themselves gradually. Three animals were treated against fluoride poisoning by means of subcutaneous injection of a therapeutic dose of caffeine and a total of 2 L. of albuminous water (one chicken egg albumin for each glass of water) per os. Mucilaginous decoctions of linseed and barley were also given per os for a period of 5 days. All 3 animals recovered.

5931. UTILIZATION OF REGENERATIVE CYCLE OF TURBINE MARK VK-50-1.
Romanenko, M.V. (Elekt. Sta. (Pvt. Sta., Moscow), June 1954, vol. 25, 17-19).
Low operating economy of this turbine was caused mainly by the unsatisfactory
performance of a mark B.I.P.-200 high pressure preheater which was frequently
being withdrawn for repair. An account is given of the modifications carried
out on the preheater as a result of which it was possible to raise the
coefficient of utilization, direct all the condensate of the heated steam from
preheaters 3, 4 and 5 through the ejector mixer in line with the main
condensate, bring the temperature of condensate after preheater No.1 to
60-32°C and after mixer (before deaerator) to 92-95°C, and raise turbine
efficiency from 29.43% to 34.50%. D.E.A.
